MAURO NAHUEL TRASSANI

Software Engineer | GeneXus · REST APIs · SQL · Docker · CI/CD | React & Node

Neuquén, Argentina (GMT-3) | mn.trassani@gmail.com | +54 299 511 6729 | LinkedIn | GitHub

PROFESSIONAL SUMMARY

Software developer with 7+ years building enterprise web and mobile systems across the full development cycle, with GeneXus as the main stack — legacy modernization (GeneXus 9 to 17 migrations), offline-first mobile apps, and REST integrations over SQL Server, MySQL, Oracle and DB2, with Docker and CI/CD. As a consultancy resource I have rotated across portfolios and domains: insurance, retail, field services, oil and gas, agricultural export, healthcare and public administration. I gravitate to the end-to-end side of engineering: debugging and integration between systems, tracing problems from symptom to root cause across the whole stack. Certified GeneXus 18 Analyst (90/100). Expanding into the modern JavaScript stack — React in production, migrating GeneXus modules to REST services with React front ends, and Node/Express in progress.

TECHNICAL SKILLS

GeneXus: Versions 9/16/17/18, Smart Devices, External Objects, GXserver (Team Development) | Patterns: WorkWithPlus, WorkWith Web, K2BTools | Generators: Java, .NET Core, .NET Framework | Legacy modernization (GX9 → GX17 migrations)

APIs & Integrations: REST API design, implementation and consumption | Postman

Databases: SQL Server, MySQL, PostgreSQL, Oracle SQL, DB2, MongoDB | Query optimization and relational design

DevOps & Deployment: Docker, Jenkins (CI/CD), Tomcat, IIS, Deploy Units

Web & Frontend: HTML, CSS, JavaScript, React | Node.js/Express (in progress — Coderhouse Full Stack program)

Tools & Methodologies: Git/GitHub, Scrum | Jira, ClickUp, Trello

PROFESSIONAL EXPERIENCE

GeneXus Developer — Valkimia*2023 – Present*

- Responsible for migrating the claims-settlement module of a large insurance system from GeneXus 9 to GeneXus 17 (Java-generated, Tomcat, K2BTools), with the legacy system live in production — defining how each component is migrated to preserve legacy behavior, gathering requirements directly with end users through iterative, screen-by-screen delivery, and re-architecting legacy transactions into Web Panels and SDTs while solving framework-level state-management challenges.
- Reverse-engineered a large, undocumented legacy module into a functional analysis — mapping existing behavior and pending scope — that the client's own specification didn't provide, giving the team the reference needed to prioritize and drive the migration.
- Migrated the absence-management module of a payroll system for a global HR company, within a ten-person team with dedicated QA and environment-based promotion (Test, UAT and production), coordinating GXserver freezes and branches with the client's own team.
- Technical owner of the core modules of a supermarket chain's management platform, integrated through daily synchronization with the group's corporate ERP (an AS/400 in Spain): store replenishment with direct-from-supplier ordering (web backend + mobile app), label printing, and product-expiry alerting with RPA integration. Five GeneXus KBs across four versions (9, 16, 17 and 18), three databases, REST services and batch processing.
- Unblocked broken or inherited development environments that others couldn't get running — diagnosing infrastructure-level issues such as database charset/collation mismatches (resolved via custom JDBC configuration) and orphaned build artifacts — so development and client-ticket resolution could proceed.
- Designed and built an automated stock-replenishment integration (Relex): daily batch processing of suggestion files of up to 150,000 rows generating draft purchase orders, with operator review on mobile and automatic confirmation and dispatch to suppliers — replacing manual order management across stores.

- Led a structured knowledge-transfer program: trained an incoming external development team on six core modules through hands-on handover sessions, documentation and joint support-ticket resolution (Jira).
- Maintained CI/CD pipelines (Jenkins) with fully automated test deployments (Tomcat, IIS, Docker) and coordinated production releases with documented runbooks.

Freelance GeneXus Developer — Field services company*Sep 2025 – Present*

- Migrated a legacy payroll-attendance report from a GeneXus Excel export to a REST service consumed by a React SPA, now in production with real payroll data — designing the JSON contract, the service layer and the front end, and keeping the legacy process untouched as a comparison control.
- Built the attendance-generation process behind that report and cut unjustified absences from 145 to 37 in one month (74%) — the gap were rotating-shift rest days the report counted as absences. Validated with nine SQL checks, one recalculating the shift rule outside the code, over 331 generated records with zero discrepancies.
- Sole developer of an offline-first Android field-services application (GeneXus Smart Devices), in parallel with full-time employment: 64-table offline SQLite database with bidirectional synchronization, digital client signature, photos and QR scanning. In production (v1.0) since July 2026.
- Diagnosed and resolved database-level synchronization failures (MySQL packet and GROUP_CONCAT limits) that blocked full-database sync, restoring reliable offline operation for field technicians.

GeneXus Developer — Inenco SRL*2019 – 2023*

- Built from scratch the mobile applications (GeneXus Smart Devices) of two industry management systems, covering the full cycle — functional analysis, development and testing — alongside the team building the web counterpart: well-work logging for a provincial authority's integrated hydrocarbon information management system, and pallet and container management for maritime fruit export (weighing, measuring, status tracking and dispatch control).
- Maintenance and evolution of systems for provincial public bodies: session management and document workflow for a city council — sustained single-handedly after the rest of the team left, integrating with a pre-existing workflow engine — and a human milk bank traceability system, including remote support for the label printing that underpins that traceability.

PERSONAL PROJECTS (REACT)

- E-commerce SPA, live and maintained — React 19, Vite, React Router and Context API for global cart state, over a service layer that isolates data access behind the same async contract the future API will expose, so swapping the source will not touch a single component. Handles loading, out-of-stock and empty-cart states with order confirmation. Live demo · Repo

CERTIFICATIONS

- GeneXus 18 Analyst — Jun 2025 (score: 90/100)
- GeneXus 18 Jr Analyst — Oct 2024 (score: 89/100)
- Backend Programming I: Advanced Backend Development — Coderhouse, Sep 2026
- React JS — Coderhouse, Jun 2026
- JavaScript — Coderhouse, Feb 2026
- Web Development — Coderhouse, Aug 2025

EDUCATION

University Technical Degree in Web Development — Universidad Nacional del Comahue*2018 – Present*

Full Stack Developer Program — Coderhouse*2025 – Present*

LANGUAGES

Spanish: Native
English: Intermediate (technical reading and writing) — actively improving conversational fluency
